converters (ADCs) are well known in the art. In particular, flash analog-to-digital converters (flash ADCs) and pipelined ADC (PADC) devices are well known in the art. In a pipelined ADC, the number of operations required to effect the conversion is divided into a number of stages, the number of stages typically being greater than 2. In each stage, a respective subset of bits of an input are converted to respective subsets of bits in an output, until the conversion is complete. A known pipelined ADC may be thought of as including an array of parallel processing paths. Such a pipelined ADC may be thought of as including a first path and a second path, the first path including a first plurality of adder cells and a first plurality of delay elements. The first path may be thought of as extending from a first input to an adder cell at a first output, and the second path may be thought of as extending from a second input to an adder cell at a second output. In the first path, a first input is provided at the first input and provided to the
